

INSIDER THREATS

A COUNTERINTELLIGENCE CHALLENGE

THE NATURE OF INSIDER THREATS

Insider threats are not only the most dangerous to organizations but also the most difficult to identify. Employees and vendors with authorized access to data systems, Intellectual Property (IP), trade secrets, Personal Identity Information (PII), and other forms of confidential information are prime targets to co-opt for criminal networks and intelligence operatives as they can easily obtain information of value. Insiders can also facilitate and aid in embezzlement, fraud, and various confidence schemes. Corporations, government agencies, and even larger non-profits must develop insider threat programs to identify the threats early in order to take action.

While some companies claim to have software and other technical systems to identify insider threats, these are normally limited to network interactions. People have proven that when security systems are improved to defend against a particular threat, “man” will work to find a way to circumvent or otherwise avert these security systems.

RAVEN’S APPROACH TO INSIDER THREATS

Raven’s cadre of expert consultants have decades of experience in all intelligence disciplines, including Counterintelligence. Raven utilizes Prometheus, an Artificial Intelligence (AI) powered collection platform, to collect intelligence both externally and internally to our clients. This collection is tailored to account for corporate culture, operations, and other unique situations each client is facing. The information collected is then analyzed by our team of former intelligence officers to assess the nature of the insider threats and build a complete picture, so our clients can take appropriate action.

Intelligence Collection

Prometheus, powered by proprietary Artificial Intelligence, collects targeted information from across the dark net, internet, social media, messaging applications, and many other data sources. Prometheus not only collects information but identifies specific intelligence that meets collect needs based on the parameters established. This drastically reduces manpower and allows analysts and intelligence specialist to more quickly identify threats and other problems. With a broad collection area Raven can provide insight into a vast amount of security challenges for corporations, individuals and government agencies.

Video

If you utilize video surveillance at your facilities, or as part of your counter surveillance operations, you know that monitoring video is time consuming and manpower intensive. Use Prometheus to monitor your video feeds and alert you to threats, intrusions, and other information you need.
